ABSTRACT

Detailed demographic information on the characteristics of households and families in the United States is presented in this report. The new data in this year's report are based on the current population survey conducted in March of 1981. Some highlights of the topics discussed include the following: (1) Nonfamily households accounted for 10.1 million of the 19.0 million increase in the total number of households since 1970; (2) The median age of householders in 1981 was 45.9 years, down 2.2 years from the 1970 level; (3) About 60 percent of all households in 1981 were maintained by persons who were married and living with their husbands or wives, compared with 71 percent in 1970; (4) The size of the average household has declined from 3.14 persons in 1970 to 2.73 persons in 1981; (5) About one out of every five households had a householder age 65 or older, according to both the 1981 and the 1970 survey; and (6) One-parent families accounted for 21 percent of the 31.6 million families with children in 1981, versus 11 percent of the 28.8 million families with children in 1970. Sampling variability, which may be relatively large for the smaller figures as well as for small differences between figures, is discussed in an appendix to the report. (RH)

Household and Family Characteristics: March 1981

INTRODUCTION

This report presents detailed demographic information on the characteristics of households and families. The new data in this year's report are based on the March 1981 Current Population Survey (CPS). Comparable data for subnational geographic areas will be available from the 1980 Census of Population and Housing.

The estimation procedure used in conjunction with the CPS involves the adjustment of sample results to independent estimates of the population. These independent estimates are based on civilian noninstitutional population counts from the decennial censuses. Data published in reports for earlier years were based on independent population estimates derived by updating the 1970 decennial census counts. Starting with the data collected in the March 1981 CPS, independent estimates are based on civilian noninstitutional population controls for age, race, and sex derived from the 1980 decennial census.

Some highlights of the topics discussed are:

- Nonfamily households accounted for 10.1 million of the 19.0 million increase in the total number of households since 1970.
- The median age of householders in 1981 was 45.9 years, down 2.2 years from the 1970 level.
- About 60 percent of all households in 1981 were maintained by persons who were married and living with their husband or wife, compared with 71 percent in 1970.
- The size of the average household has declined from 3.14 persons in 1970 to 2.73 persons in 1981.
- About 1 out of every 5 households had a householder age 65 or older, according to both the 1981 and the 1970 survey.
- One-parent families accounted for 21 percent of the 31.6 million families with children in 1981, versus 11 percent of the 28.8 million families with children in 1970.

All of the data presented in this report are subject to sampling variability, which may be relatively large for the smaller figures and for small differences between figures. For a further discussion of sampling variability see Appendix B, "Source and Reliability of the Estimates."

CHANGES IN THE NUMBER AND COMPOSITION OF HOUSEHOLDS

There were an estimated 82.4 million households in the United States in March 1981, according to the results of the Current Population Survey (CPS). About 73 percent were family households and 27 percent were nonfamily households (table A). A family household is a household of two or more related persons (one of whom is considered the householder); a nonfamily household is maintained by a person either living alone or with others to whom they are not related. Since 1970, the total number of households has increased by 19.0 million (30 percent). Although the number of family households was up by 8.9 million (17 percent), more than half of the increase in the total number of households since 1970 is attributable to nonfamily households which were up by 10.1 million (85 percent).

According to Census Bureau definition, there are three types of family households: 1) married-couple families, 2) other families with male householders (no wives present), or 3) other families with female householders (no husbands present). Since 1970, households maintained by married couples have increased by 10 percent, while other family households with male householders (no wives present) increased 57 percent and family households with female householders (no husbands present) increased 65 percent.

Although there were 24.9 million married-couple family households that included at least one own child under 18 in 1981, the number of such households has declined by about 2 percent since 1970. The number of married-couple family households with one or two children under 18 increased during the period, but the number with three or more such children dropped rather dramatically from 9.3 million households in 1970 to 5.7 million in 1981.

While the overall number of married-couple households with children present has declined slightly, the one-parent household total has doubled. The number of one-parent households maintained by men has increased by 325,000 (95 percent) since 1970, and the number of one-parent households maintained by women has increased by 2.8 million (97 percent).

By Bureau definition, there are two types of nonfamily households: they are maintained by either male householders or by female householders. There were 9.3 million nonfamily households maintained by males in 1981, up 128 percent over the 1970 figure. By contrast, the number of nonfamily households maintained by women in 1981 (12.8 million) had increased by only 62 percent since 1970. Regardless of whether nonfamily households have male or female householders, the person maintaining such a household is very likely to be living alone: 78 percent among men and an even higher proportion, 91 percent, among women.

Living alone	11,683	14.2	7,319	11.5	4,364	59.6

PROFILE OF AMERICAN HOUSEHOLDS

Area of residence. According to the 1981 survey, about 68 percent of all households were in metropolitan areas (as defined in the 1970 census), and 32 percent were in nonmetropolitan areas (table B). The proportion of married-couple family households residing in metropolitan areas (65 percent) was somewhat lower than the corresponding proportion of other family types living in those areas. Among male nonfamily householders, 74 percent lived in metropolitan areas versus 71 percent of the female nonfamily householder.

Region. Just over one-half (53 percent) of all households in the 1981 survey were in the South or West Regions. The proportion of all households in these two regions in 1970 was 48 percent.[1]

Race and Spanish origin. About 87 percent of persons maintaining households in 1981 were White, 11 percent were Black, and 2 percent were in some other racial category. Persons of Spanish origin (who may be of any race) maintained 5 percent of all households.

Among married-couple families, 91 percent were maintained by White persons, 7 percent by Black persons, and 2 percent by persons of other races. However, among families maintained by women alone, 69 percent of the householders were White, 29 percent were Black, and 2 percent were in another racial category. Persons of Spanish origin maintained 5 percent of married-couple families and 8 percent of the families maintained by women.

Age of householder. The median age of all householders in 1981 was 45.9 years. Overall, family householders, with a median age of 44.5 years, tended to be significantly younger than nonfamily householders, whose median age was 54.2 years. Among those maintaining nonfamily households, however, the median age of male householders (35.8 years) was much lower than for female householders (64.0 years).

Marital status. About 60 percent of all households were maintained by persons who were married and living with their husbands or wives at the time of the survey. Male householders maintaining families where the wife was absent tended to be divorced or single, whereas women maintaining families without their husbands were more likely to be divorced or widowed. Among nonfamily households, male householders were most likely to be single (49 percent), whereas female householders were generally widows (53 percent).

Size of household. There was an average of 2.73 persons per household in 1981. The largest average household size occurred among households maintained by married couples (3.34 persons per household). The average size of family households maintained by males with no wives present was 2.85 persons and 3.11 for family households maintained by females with no husbands present.

The smallest households were nonfamily households: about 78 percent of the men and 91 percent of the women maintaining nonfamily households lived alone. Consequently, the average household size was slightly higher for the men (1.30 persons) than for the women (1.11 persons).

[1] Persons of Spanish origin may be of any race.

Presence of own children. About 38 percent of all households in 1981 contained at least one child of the householder under 18 years of age. Just over one-half (51 percent) of married-couple families included one or more children. Fathers living with their children accounted for 35 percent of the male householders maintaining families where the wife was not present. About 62 percent of the women maintaining families where the husband was not present were mothers living with their children. Nonfamily households, by Census definition, do not contain any children of the householder.

Nonrelatives. Household members who are not related to the householder through either blood, marriage, or adoption are considered to be nonrelatives. The vast majority of households do not include any such persons among their members. As of 1981, nonrelatives were present in about 5 percent of the 82.4 million households. They were most likely to be found in nonfamily households maintained by men, 22 percent of which included one or more nonrelatives. Many of the nonfamily households which include nonrelatives contain an "unmarried couple," i.e., two unrelated adults of the opposite sex.

Tenure. Almost 68 percent of householders own their homes. Family householders, however, were more likely to own their homes (75 percent) than were nonfamily householders (48 percent). Among family households maintained by women with no husbands present, there were as many renters as owners. However, renters clearly outnumbered owners among nonfamily households maintained by males.

HOUSEHOLDS MAINTAINED BY PERSONS 65 YEARS OLD AND OVER

About 1 out of every 5 households in the United States had a householder who was 65 years old or over in 1981. A majority of these households were maintained by families (54 percent): 45 percent were maintained by a married couple and 9 percent by other types of families. In many instances, however, these older householders did not have a relative living with them; about 46 percent were nonfamily householders, and about 97 percent of these were living alone (table C).

Given the relatively high probability of death for a spouse at older ages, the tendency toward nonfamily living arrangements is even more pronounced for householders age 75 and over. About 56 percent of these householders had no relatives living with them, and as with those 65 and over, 97 percent of the nonfamily householders 75 and over lived alone.

Although most older householders lived in metropolitan areas, the proportion living in nonmetropolitan areas was higher than that for households overall: 32 percent for all households, compared with 37 percent for households maintained by persons age 65 and over and 39 percent for those maintained by persons 75 and over.

About 90 percent of the householders 65 and over were White, a slightly higher proportion than that among householders of all ages (87 percent). Correspondingly, the proportion of the older householders who were Black or in the "other" racial category was slightly lower than that among householders of all ages.

Older householders are more likely to be widowed. About 13 percent of all persons maintaining households in 1981 were widowed; this proportion was much higher among householders 65 and over (43 percent) and 75 and over (56 percent). By contrast, the proportion who were married and living with their spouses decreased from 45 percent for those 65 and over to 34 percent for those 75 and over. Roughly 5 percent of the householders over the age of 65 had never married.

Since so many older householders live alone, their average household size is relatively low. The average for all households (2.73 persons per household) is almost one person higher than the average for households maintained by persons age 65 and over (1.74 persons). The average is even lower for households maintained by those age 75 and over (1.57 persons).

ONE-PARENT FAMILIES

Between 1970 and 1981, the number of families that included own children under 18 increased by 2.7 million. During this same period, however, the number of families where two parents were present declined by 606,000, while the number of one-parent families increased by 3.4 million (table D).

One-parent families accounted for 21 percent (about 1 out of 5) of the 31.6 million families with children in 1981; the corresponding proportion in 1970 was 11 percent (about 1 out of 10).

Families maintained by just one of a child's parents result from one of three situations: the parents have never married, one parent dies and the surviving parent has not remarried, or one of the parents is living elsewhere (usually because of separation or divorce) and the parent with whom the child resides is either not free to remarry or has chosen not to do so. Since 1970, the number of families maintained by a never-married parent has increased by 349 percent, those maintained by a widowed parent have declined by 5 percent, and those maintained by a parent who is divorced, separated, or living apart from their spouse for some other reason have increased by 111 percent. Thus, the increase in one-parent families is entirely due to two of the three possible contributors.

The vast majority (90 percent) of one-parent families are maintained by the mother. Although the number of such families maintained by the father has increased by 101 percent since 1970, the number maintained by the mother has increased just as much.

In 1981, about one-half of Black families with children at home were one-parent families as compared with one-sixth of White families with children. Black one-parent families were even more likely than White one-parent families to be maintained by the mother rather than the father. Although the incidence of one-parent families was higher among Blacks than Whites, 68 percent of all families maintained by one parent in 1981 were maintained by Whites.

RELATED REPORTS

Data for 1981 and earlier years on households and families by type were published in Series P-20, No. 367, *Households and Families, by Type: March 1981 (Advance Report).* Figures for 1981 on the sex, age, marital status, and living arrangements of persons will be issued in Series P-20, *Marital Status and Living Arrangements: March 1981.* Figures on projections for the United States of the number of households and families from 1979 to 1995 have been published in Series P-25, No. 805. More comprehensive information on married couples was published in 1978 in Series P-23, No. 77, *Perspectives on American Husbands and Wives.* Results of a study on the marital history of men and women are provided in Series P-20, No. 297, *Number, Timing, and Duration of Marriages and Divorces in the United States: June 1975* and Series P-20, No. 312, *Marriage, Divorce, Widowhood, and Remarriage by Family Characteristics: June 1975.* Statistics on the characteristics of families maintained by women were presented in Series P-23, No. 107, *Families Maintained by Female Householders, 1970-79*

Statistics on households, families, and related subjects for 1970 for standard metropolitan statistical areas, counties, urbanized areas, cities, States, regions, and the United States are presented in 1970 Census of Population, Volume 1, *Characteristics of the Population,* Chapters B, C, and D. Detailed statistics on households and families by age of householder for 1970 for States and for large counties and standard metropolitan statistical areas are available in Volume 1, Chapter D, "Detailed Characteristics." Similar data for 1980 are being published in 1980 Census of Population, Volume 1, *Characteristics of the Population.* The various component parts of this volume will continue to be issued throughout 1982 and 1983.

Appendix A. Definitions and Explanations

Coverage. The population in this report includes the civilian noninstitutional population of the United States plus approximately 817,000 members of the Armed Forces in the United States living off post or with their families on post in 1981 but excludes all other members of the Armed Forces.

Symbols. A dash (–) represents zero or rounds to zero. The symbol "B" means that the base for the derived figure is less than 75,000. An "X" means not applicable, and "NA" means not available.

Rounding of estimates. Individual figures are rounded to the nearest thousand without being adjusted to group totals, which are independently rounded; percentages are based on the unrounded numbers.

Age. The age classification is based on the age of the person at the person's last birthday. The adult universe (i.e., population of marriageable age) is now comprised of persons 15 years old and over. Prior to 1980 the adult universe was 14 years old and over.

Race. The population is divided into three groups on the basis of race: White, Black, and "other races." The last category includes Indians, Japanese, Chinese, and any other race except White and Black.

Persons of Spanish origin. Persons of Spanish origin in this report were determined on the basis of a question that asked for self-identification of the person's origin or descent. Respondents were asked to select their origin (or the origin of some other household member) from a "flash card" listing ethnic origins. Persons of Spanish origin, in particular, were those who indicated that their origin was Mexican, Puerto Rican, Cuban, Central or South American, or some other Spanish origin. Persons of Spanish origin may be of any race.

Marital status. The marital status classification identifies four major categories: single (never married), married, widowed, and divorced. These terms refer to the marital status at the time of the enumeration.

The category "married" is further divided into "married, spouse present," "separated," and "other married, spouse absent." A person was classified as "married, spouse present" if the husband or wife was reported as a member of the household, even though he or she may have been temporarily absent on business or on vacation, visiting, in a hospital, etc., at the time of the enumeration. Persons reported as separated included those with legal separations, those living apart with intentions of obtaining a divorce, and other persons permanently or temporarily separated because of marital discord. The group "other married, spouse absent" includes married persons living apart because either the husband or wife was employed and living at a considerable distance from home, was serving away from home in the Armed Forces, had moved to another area, or had a different place of residence for any other reason except separation as defined above.

Husband in Armed Forces. When a woman was reported as married but her husband was not enumerated as a member of the same household, an additional question was asked to determine whether her husband was in the Armed Forces. Women who were reported as separated were not asked the additional question.

Household. A household consists of all the persons who occupy a housing unit. A house, an apartment or other group of rooms, or a single room, is regarded as a housing unit when it is occupied or intended for occupancy as separate living quarters; that is, when the occupants do not live and eat with any other persons in the structure and there is either (1) direct access from the outside or through a common hall or (2) a kitchen or cooking equipment for the exclusive use of the occupants.

A household includes the related family members and all the unrelated persons, if any, such as lodgers, foster children, wards, or employees who share the housing unit. A person living in a housing unit, or a group of unrelated persons sharing a housing unit as partners, is also counted as a household. The count of households excludes group quarters.

Group quarters. Group quarters are defined in the Current Population Survey as noninstitutional living arrangements for groups not living in conventional housing units or groups living in housing units containing five or more persons unrelated to the person in charge. Beginning in 1972, inmates of institutions have not been included in the Current Population Survey.

Householder. The householder refers to the person (or one of the persons) in whose name the housing unit is owned or rented (maintained) or, if there is no such person, any adult member, excluding roomers, boarders, or paid employees. If the house is owned or rented jointly by a married couple, the householder may be either the husband or the wife. The person designated as the householder is the "reference person" to whom the relationship of all other household members, if any, is recorded.

Prior to 1980, the husband was always considered the householder in married couple households. The number of householders is equal to the number of households. Also, the number of family householders is equal to the number of families.

Head versus householder. Beginning with the 1980 CPS, the Bureau of the Census discontinued the use of the terms "head of household" and "head of family." Instead, the terms "householder" and "family householder" are used. Recent social changes have resulted in greater sharing of household responsibilities among the adult members and, therefore, have made the term "head" increasingly inappropriate in the analysis of household and family data. Specifically, the Bureau has discontinued its longtime practice of always classifying the husband as the reference person (head) when he and his wife are living together.

In this report, the term "householder" is used in the presentation of data that had previously been presented with the designation "head." The householder is the first adult household member listed on the questionnaire. The nstructions call for listing first the person (or one of the persons) in whose name the home is owned or rented. If a home is owned jointly by a married couple, either the husband or the wife may be listed first, thereby becoming the reference person, or householder, to whom the relationship of other household members is to be recorded.

Family. A family is a group of two persons or more (one of whom is the householder) related by birth, marriage, or adoption and residing together; all such persons (including related subfamily members) are considered as members of one family. Beginning with the 1980 CPS, unrelated subfamilies (referred to in the past as secondary families) are no longer included in the count of families, nor are the members of unrelated subfamilies included in the count of family members.

Family household. A family household is a household maintained by a family (as defined above), and any unrelated persons (unrelated subfamily members and/or secondary individuals) who may be residing there are included. The number of family households is equal to the number of families. The count of family household members differs from the count of family members, however, in that the family household members include all persons living in the household, whereas family members include only the householder and his/her relatives. (See the definition of family.)

Subfamily. A related subfamily is a married couple with or without children, or one parent with one or more own single (never married) children under 18 years old, living in a household and related to, but not including, the person or couple who maintains the household. The most common example of a related subfamily is a young married couple sharing the home of the husband's or wife's parents. The number of related subfamilies is not included in the count of families.

Unrelated subfamily. An unrelated subfamily (formerly called a secondary family) is a group of two persons or more who are related to each other by birth, marriage, or adoption, but who are not related to the householder. The unrelated subfamily may include persons such as guests, roomers, boarders, or resident employees and their relatives living in a household. The number of unrelated subfamily members is included in the number of household members but is not included in the count of family members.

Persons living with relatives in group quarters were formerly considered as members of unrelated subfamilies. However, the number of such unrelated subfamilies became so small (37,000 in 1967) that beginning with data for 1968 (and beginning with census data for 1960) the Bureau of the Census includes persons in these unrelated subfamilies in the count of secondary individuals.

Married couple. A married couple, as defined for census purposes, is a husband and wife enumerated as members of the same household. The married couple may or may not have children living with them. The expression "husband-wife" or "married-couple" before the term "household," "family," or "subfamily" indicates that the household, family, or subfamily is maintained by a husband and wife. The number of married couples equals the count of married-couple families plus related and unrelated married-couple subfamilies.

Unrelated individuals. Unrelated individuals are persons of any age (other than inmates of institutions) who are not living with any relatives. An unrelated individual may be (1) a person living alone or with nonrelatives only, (2) a roomer, boarder, or resident employee with no relatives in the household, or (3) a group quarters member who has no relatives living with him/her. Thus, a widow who occupies her house alone or with one or more other persons not related to her, a roomer not related to anyone else in the housing unit, a maid living as a member of her employer's household but with no relatives in the household, and a resident staff member in a hospital living apart from any relatives are all examples of unrelated individuals.

Nonfamily householder. A nonfamily householder (formerly called a primary individual) is a person maintaining a household while living alone or with nonrelatives only.

Secondary individual. A secondary individual is a person in a household or group quarters such as a guest, roomer, boarder, or resident employee (excluding nonfamily householders and inmates of institutions) who is not related to any other person in the household or group quarters. (See section on unrelated subfamily for slight change in coverage of secondary individuals in 1968.)

Size of household, family, or subfamily. The term "size of household" includes all persons occupying a housing unit. "Size of family" includes the family householder and all other persons in the living quarters who are related to the householder by birth, marriage, or adoption. "Size of related subfamily" includes the husband and wife or the lone parent and their never-married sons and daughters under 18 years of age. "Size of unrelated subfamily" includes the reference person and all other members related to the reference person. If a family has a related subfamily among its members, the size of the family includes the members of the related subfamily.

Related persons and family members. In the classification of households by number of related persons, the person or couple who maintains the household or (housing unit) and all persons in the household related to them are included. In the classification of families by number of family members, all persons in the family are included. The number of family members is the same as the size of the family.

Own children and related children. "Own" children in a family are sons and daughters, including stepchildren and adopted children, of the householder. Similarly, "own" children in a subfamily are sons and daughters of the married couple or parent in the subfamily. (All children shown as members of related subfamilies are own children of the person(s) maintaining the subfamily.) "Related" children in a family include own children and all other children in the household who are related to the householder by birth, marriage, or adoption. For each type of family unit identified in the CPS, the count of own children under 18 years old is limited to single (never married) children; however, "own children under 25" and "own children of any age," as the terms are used here, include all children regardless of marital status. The totals include never-married children living away from home in college dormitories.

The count of related children in families was formerly restricted to single (never married) children. However, beginning with data for 1968 the Bureau of the Census includes ever-married children under the category of related children. This change added approximately 20,000 children to the category of related children in March 1968.

Tenure. A housing unit is "owner occupied" if the owner or co-owner lives in the unit, even if it is mortgaged or not fully paid for. A cooperative or condominium unit is "owner occupied" only if the owner or co-owner lives in it. All other occupied units are classified as "renter occupied," including units rented for cash rent and those occupied without payment of cash rent.

Units in structure. In the determination of the number of units in a structure, all housing units, both occupied and vacant, were counted. The statistics are presented in terms of the number of occupied housing units in structures of specified size, not in terms of the number of residential structures.

Years of school completed. In this report, data on years of school completed were derived from the combination of answers to two questions, (a) "What is the highest grade of school that the person has attended?" and (b) "Did the person finish this grade?"

The questions on educational attainment applied only to progress in "regular" schools. Such schools include public, private, and parochial elementary and high schools (both junior and senior high), colleges, universities, and professional schools, whether day schools or night schools. Thus, "regular" schooling is that which advances a person toward an elementary or high school diploma, or a college, university, or professional school degree. Schooling in other than regular schools was counted only if the credits obtained were regarded as transferable to a school in the regular school system.

Labor force and employment status. The definitions of labor force and employment status in this report related to the population 15 years old and over.

Employed. Employed persons comprise (1) all civilians who, during the specified week, did any work at all as paid employees or in their own business or profession, or on their own farm, or who worked 15 hours or more as unpaid workers on a farm or in a business operated by a member of the family, and (2) all those who were not working but who had jobs or businesses from which they were temporarily absent because of illness, bad weather, vacation, or labor-management dispute, or because they were taking time off for personal reasons, whether or not they were paid by their employers for time off, and whether or not they were seeking other jobs. Excluded from the employed group are persons whose only activity consisted of work around the house (own home housework, painting or repairing own home, etc.) or volunteer work for religious, charitable, and similar organizations.

Unemployed. Unemployed persons are those civilians who, during the survey week, had no employment but were available for work and (1) had engaged in any specific job-seeking activity within the past 4 weeks, such as registering at a public or private employment office, meeting with prospective employers, checking with friends or relatives, placing or answering advertisements, writing letters of application, or being on a union or professional register, (2) were waiting to be called back to a job from which they had been laid off; or (3) were waiting to report to a new wage or salary job within 30 days.

Labor force. Persons are classified as in the labor force if they were employed as civilians, unemployed, or in the Armed Forces during the survey week. The "civilian labor force" is comprised of all civilians classified as employed or unemployed.

Not in the labor force. All civilians who are not classified as employed or unemployed are defined as "not in the labor force." This group who are neither employed nor seeking work includes persons engaged only in own home housework, attending school, or unable to work because of long-term physical or mental illness; persons who are retired or too old to work, seasonal workers for whom the survey week fell in an off season, and the voluntary idle. Persons doing only unpaid family work (less than 15 hours) are also classified as not in the labor force.

Occupation. The data on occupation of employed persons refer to the civilian job held during the survey week. Persons employed at two or more jobs were reported in the job at which they worked the greatest number of hours during the week.

The occupation groupings used here are mainly the major groups used in the 1970 Census of Population. The composition of these groups is shown in Volume 1, *Characteristics of the Population,* Part 1, United States Summary, Chapter D. The categories used are either detailed classifications or combinations thereof.

Metropolitan-nonmetropolitan residence. The population residing in standard metropolitan statistical areas (SMSA's) constitutes the metropolitan population. Except in New England, an SMSA is a county or group of contiguous counties which contains at least one city of 50,000 inhabitants or more, or "twin cities" with a combined population of at least 50,000. In addition to the county, or counties, containing such a city or cities, contiguous counties are included in an SMSA if, according to certain criteria, they are essentially metropolitan in character and are socially and economically integrated with the central county. In New England SMSA's consist of towns and cities, rather than counties. The metropolitan population in this report is based on SMSA's as defined in the 1970 census and does not include any subsequent additions or changes.

Changes in CPS design and procedures over the last several years have made the annual series of sample population data for metropolitan and nonmetropolitan areas inconsistent. Analytic comparisons of year-to-year changes in these figures should be avoided. Trends in metropolitan and nonmetropolitan population growth over the 1970-81 period should not be appreciably affected by the procedural changes.

The major revisions to the CPS sample design and estimation methods have involved the expansion of the number of sample units from 55,000 housing units to 69,000 occupied households. This incorporation of supplemental housing units into the March CPS sample in 1977 was accompained by new procedures for inflating the sample results to reflect national estimates. It was determined subsequent to the introduction of the additional sample that the new inflating (weighting) procedures used for processing both the March 1977 and March 1978 CPS supplement data had resulted in an apparent overestimate of the nonmetropolitan population and corresponding underestimate of the metropolitan population for those years. For the March 1979 CPS, another revision of the weighting process was introduced to correct the problem discovered in the earlier procedures. The result of this change was a large spurious increase in the metropolitan population and decrease in the nonmetropolitan population relative to March 1978 CPS levels.

Since 1979 metropolitan-nonmetropolitan population estimates also reflect other operational changes including the introduction of a coverage improvement sample designed to provide greater accuracy in survey estimation. The net effect of all changes in procedure was to increase the metropolitan area estimates.

Central cities. Each SMSA must include at least one central city, and the complete title of an SMSA identifies the central city or cities. If only one central city is designated, then it must have 50,000 inhabitants or more. The area title may include, in addition to the largest city, up to two city names on the basis and in the order of the following criteria: (1) The additional city has at least 250,000 inhabitants or (2) the additional city has a population of one-third or more of that of the largest city and a minimum population of 25,000. An exception occurs where two cities have contiguous boundaries and constitute, for economic and social purposes, a single community of at least 50,000, the smaller of which must have a population of at least 15,000.

Income. Data on income cover money income only, prior to deduction for taxes, received from such sources as wages or salaries, net income from self-employment, Social Security, dividends, interest, public assistance and welfare, unemployment compensation, government pensions, and veterans payments. Certain money receipts such as capital gains are not included. For a more detailed explanation, see Bureau of the Census, Current Population Reports, Series P-60.

Appendix B. Source and Reliability of the Estimates

SOURCE OF DATA

The estimates in this report are based on data obtained from the Current Population Survey (CPS) of the Bureau of the Census. The CPS estimates are based on data obtained in March of 1970 and 1981. The monthly CPS deals mainly with labor force data for the civilian noninstitutional population. Questions relating to labor force participation are asked about each member 14 years old and older in each sample household. In addition, supplementary questions are asked each March about household and family characteristics. In order to obtain more reliable data for the Spanish-origin population, the March CPS sample was enlarged to include all households from the previous November sample which contained at least one sample person of Spanish origin. For this report, persons in the Armed Forces living off post or with their families on post are included.

The present CPS sample was initially selected from the 1970 census files with coverage in all 50 States and the District of Columbia. The sample is continually updated to reflect new construction. The current CPS sample is located in 629 areas comprising 1,133 counties, independent cities, and minor civil divisions in the Nation. In this sample, approximately 69,000 occupied households were eligible for interview. Of this number, about 3,000 occupied units were visited but interviews were not obtained because the occupants were not found at home after repeated calls or were unavailable for some other reason.

The following table provides a description of some aspects of the CPS sample designs in use during the referenced data collection periods.

The estimation procedure used in this survey involved the inflation of the weighted sample results to independent estimates of the total civilian noninstitutional population of the United States by age, race, and sex. These independent estimates were based on statistics from decennial censuses; statistics on births, deaths, immigration and emigration; and statistics on the strength of the Armed Forces. The estimation procedure in March for the data in the report also involved a further adjustment so that husband and wife of a household received the same weight.

RELIABILITY OF THE ESTIMATES

Since the CPS estimates in this report are based on a sample, they may differ somewhat from the figures that would have been obtained if a complete census had been taken using the same questionnaires, instructions, and enumerators. There are two types of errors possible in an estimate based on a sample survey: sampling and nonsampling. The standard errors provided for this report primarily indicate the magnitude of the sampling error. They also partially measure the effect of some nonsampling errors in response and enumeration, but do not measure any systematic biases in the data. The full extent of nonsampling error is unknown. Consequently, particular care should be exercised in the interpretation of figures based on a relatively small number of cases or on small differences between estimates.

Nonsampling variability. Nonsampling errors can be attributed to many sources, e.g., inability to obtain information about all cases in the sample, definitional difficulties, differences in the interpretation of questions, inability or unwillingness on the part of the respondents to provide correct information, inability to recall information, errors made in collection such as in recording or coding the data, errors made in processing the data, errors made in estimating values for missing data, and failure to represent all units with the sample (undercoverage).

Undercoverage in the CPS results from missed housing units and missed persons within sample households. Overall undercoverage, compared to the level of the decennial

Description of the Current Population Survey

Time period	Number of sample areas[1]	Housing units eligible	
		Interviewed	Not interviewed
March 1981.............................	629	66,000	3,000
March 1970.............................	449	48,000	2,000

[1] These areas were chosen to provide coverage in each State and the District of Columbia.

census, is about 5 percent. It is known that CPS undercoverage varies with age, sex, and race. Generally, undercoverage is larger for males than for females and larger for Blacks and other races than for Whites. Ratio estimation to independent age-sex-race population controls, as described previously, partially corrects for the bias due to survey undercoverage. However, biases exist in the estimates to the extent that missed persons in missed households or missed persons in interviewed households have different characteristics than interviewed persons in the same age-sex-race group. Further, the independent population controls used have not been adjusted for undercoverage in the 1970 census, which was estimated at 2.5 percent of the population, with similar undercoverage differentials by age, sex, and race as in CPS.

A coverage improvement sample was included in computing the estimates beginning in 1978 in order to provide coverage of mobile homes and new construction housing units which previously had no chance for selection in the CPS sample. This sample is composed of approximately 450 sample housing units which represent 237,000 occupied mobile homes and 600,000 new construction housing units. These new construction units are composed of those units where building permits were issued prior to January 1970 and construction was not completed by the time of the 1970 census (i.e., April 1970). The inclusion of this coverage improvement sample in the CPS does not have a significant effect on the estimates. The extent of other sources of housing undercoverage is unknown but believed to be small.

Sampling variability. The standard errors given in the following tables are primarily measures of sampling variability, that is, of the variation that occurred by chance because a sample rather than the entire population was surveyed. The sample estimate and its standard error enable one to construct confidence intervals – ranges that would include the average result of all possible samples with a known probability. For example, if all possible samples were selected, each of these was surveyed under essentially the same general conditions and using the same sample design, and if an estimate and its standard error were calculated from each sample, then:

1. Approximately 68 percent of the intervals from one standard error below the estimate to one standard error above the estimate would include the average result of all possible samples.

2. Approximately 90 percent of the intervals from 1.6 standard errors below the estimate to 1.6 standard errors above the estimate would include the average result of all possible samples.

3. Approximately 95 percent of the intervals from two standard errors below the estimate to two standard errors above the estimate would include the average result of all possible samples.

The average estimate derived from all possible samples may or may not be contained in any particular computed interval. However, for a particular sample, one can say with a specified confidence that the average estimate derived from all possible samples is included in the confidence interval.

Standard errors may also be used to perform hypothesis testing, a procedure for distinguishing between population parameters using sample estimates. The most common types of hypothesis appearing in this report are 1) the population parameters are identical or 2) they are different. An example of this would be comparing the average size of households maintained by male householders versus that maintained by female householders. Tests may be performed at various levels of significance, where a level of significance is the probability of concluding that the parameters are different when, in fact, they are identical.

All estimates of comparison in the text have passed a hypothesis test at the 0.10 level of significance or better, and most have passed a hypothesis test at the 0.05 level of significance or better. This means that, for most differences cited in the text, the estimated difference between parameters is greater than twice the standard error of the difference. For the other differences mentioned, the estimated difference between parameters is between 1.6 and 2.0 times the standard error of the difference. When this is the case, the statement of comparison will be qualified in some way, e.g., by use of the phrase "some evidence."

Comparability with other data. Caution should be exercised in comparing metropolitan and nonmetropolitan area estimates from 1976 and later years to each other and to those from earlier years. Methodological and sample design changes have occurred in these recent years resulting in relatively large differences in the metropolitan and nonmetropolitan area estimates.

Note when using small estimates. Summary measures (such as averages and percent distributions) are shown in the report only when the base of the measure is 75,000 or greater. Because of the large standard errors involved, there is little chance that summary measures would reveal useful information when computed on a smaller base. Estimated numbers are shown, however, even though the relative standard errors of these numbers are larger than those for corresponding percentages. These smaller estimates are provided primarily to permit such combinations of the categories as serve each user's need.

Standard error tables and their use. In order to derive standard errors that would be applicable to a large number of estimates and could be prepared at a moderate cost, a number of approximations were required. Therefore, instead of providing an individual standard error for each estimate, generalized sets of standard errors are provided for various types of characteristics. As a result, the sets of standard errors provided give an indication of the order of magnitude of the standard error of an estimate rather than the precise standard error.

The figures in tables B-1 and B-2 provide approximations to standard errors of estimated numbers and estimated percentages. Standard errors for intermediate values not shown in the generalized tables of standard errors may be approximated by linear interpolation. Estimated standard errors for specific characteristics cannot be obtained from tables B-1 or B-2 without the use of factors in table B-3. These factors must be applied to the generalized standard errors in order to adjust for the combined effect of sample design and estimating procedure on the value of the characteristic. The factors for all household members should be used for characteristics pertaining to all persons in a household. For characteristics which include only some household members, such as "children under 18 years of age," the factor for some household members should be used.

Two parameters (denoted "a" and "b") are used to calculate standard errors for each type of characteristic; they are presented in table B-4. These parameters were used to calculate the standard errors in tables B-1 and B-2, and to calculate the factors in table B-3. They also may be used to directly calculate the standard errors for estimated numbers and percentages. Methods for direct computation are given in the following sections.

Standard errors of estimated numbers. The approximate standard error, σ_x, of an estimated number shown in this report can be obtained in two ways. It may be obtained by use of the formula

$$\sigma_x = f\sigma \qquad (1)$$

where f is the appropriate factor from table B-3, and σ is the standard error on the estimate obtained by interpolation from table B-1. Alternatively, standard errors may be approximated by the following formula (2) from which the standard errors were calculated in table B-1. Use of this formula will provide more accurate results than the use of formula (1) above.

$$\sigma_x = \sqrt{ax^2 + bx} \qquad (2)$$

Here x is the size of the estimate and a and b are the parameters in table B-4 associated with the particular type of characteristic. When calculating standard errors for numbers

Table B-1. Standard Errors of Estimated Numbers

(68 chances out of 100. Numbers in thousands)

Size of estimate	Standard error	Size of estimate	Standard error
25	9	5,000	131
50	13	10,000	182
100	19	15,000	221
250	30	25,000	277
500	42	50,000	364
1,000	59	100,000	424
2,500	93		

Note: For a particular characteristic, see table B-3 for the appropriate factor to apply to the above standard errors.

Table B-2. Standard Errors of Estimated Percentages

(68 chances out of 100)

Base of estimated percentage (thousands)	Estimated percentage					
	1 or 99	2 or 98	5 or 95	10 or 90	25 or 75	50
75	2.1	3.0	4.7	6.5	9.4	10.8
100	1.9	2.6	4.1	5.6	8.1	9.4
250	1.2	1.7	2.6	3.5	5.1	5.9
500	0.8	1.2	1.8	2.5	3.6	4.2
1,000	0.6	0.8	1.3	1.8	2.6	3.0
2,500	0.4	0.5	0.8	1.1	1.6	1.9
5,000	0.3	0.4	0.6	0.8	1.1	1.3
10,000	0.2	0.3	0.4	0.6	0.8	0.9
15,000	0.15	0.2	0.3	0.5	0.7	0.8
25,000	0.12	0.2	0.3	0.4	0.5	0.6
50,000	0.08	0.12	0.2	0.3	0.4	0.4
100,000	0.06	0.08	0.13	0.2	0.3	0.3

Note: For a particular characteristic, see table B-3 for the appropriate factor to apply to the above standard errors.

from cross-tabulations involving different characteristics, use the factor or set of parameters for the characteristic which will give the largest standard error.

Illustration of the computation of the standard error of an estimated number. Table A of this report shows that in 1981 there were 22,059,000 nonfamily households. Using formula (2) with a = −0.000010 and b = 1389 from table B-4, the approximate standard error[1] is

$$\sqrt{(-0.000010)\,(22{,}059{,}000)^2 + (1389)\,(22{,}059{,}000)} \doteq 161{,}000$$

The chances are 68 out of 100 that the estimate would have been a figure differing from the average of all possible samples by less than 161,000. The chances are 95 out of 100 that the estimate would have been a figure differing from the average of all possible samples by less than 322,000 (twice the standard error), i.e., the 95-percent confidence interval for the number of nonfamily households is from 21,737,000 to 22,381,000.

Standard errors of estimated percentages. The reliability of an estimated percentage, computed using sample data for both numerator and denominator, depends upon both the size of the percentage and the size of the total upon which the percentage is based. Estimated percentages are relatively more reliable than the corresponding estimates of the numerators of the percentages, particularly if the percentages are 50 percent or more. When the numerator and denominator of the percentage are in different categories, use the factor or parameters from table B-3 or B-4 indicated by the numerator. The approximate standard error, $\sigma_{(x,p)}$, of an estimated percentage can be obtained by use of the formula

$$\sigma_{(x,p)} = f\sigma \qquad (3)$$

In this formula f is the appropriate factor from table B-3, and σ is the standard error on the estimate from table B-2. Alternatively, standard errors may be approximated by formula (4), from which standard errors in table B-2 were calculated; direct computation will give more accurate results than use of the standard error tables and the factors.

$$\sigma_{(x,p)} = \sqrt{\frac{b}{x} \cdot p\,(100-p)} \qquad (4)$$

Here x is the size of the subclass of persons, families and unrelated individuals, households, or householders which is the base of the percentage, p is the percentage ($0 \leq p \leq 100$), and b is the parameter in table B-4 associated with the particular type of characteristic in the numerator of the percentage.

Illustration of the computation of the standard error of a percentage. Table A shows that of the 82,368,000 households in 1981, 59.8 percent were maintained by married-couple families. From table B-4 the appropriate parameter b is 1389.

Using formula (4), the approximate standard error[2] on 59.8 percent is

$$\sqrt{\frac{1389}{82{,}368{,}000}\,(59.8)(40.2)} \doteq 0.2 \text{ percent}$$

---

[1] Using formula (1), table B-1 and the appropriate factor from table B-3, the approximate standard error is 0.63 x 261,000 = 164,000.

[2] Using formula (3), tables B-2 and B-3, the approximate standard error is also 0.2 percent.

Table B-3. Factors to be Applied to Generalized Standard Errors in Tables B-1 and B-2

Characteristic	CPS data collected January 1967 to present								
	Persons						Families and unrelated individuals, households, or householders

[1] Use this parameter to calculate standard errors of estimated percentages only.

[2] Use these parameters to calculate standard errors of estimated levels only.

Consequently, the chances are 68 out of 100 that the estimated percent would be within 0.2 percentage points of the average of all possible samples. Chances are 95 out of 100 that the estimate would be within 0.4 percentage points of the average of all possible samples, i.e., the 95-percent confidence interval for the percentage of households maintained by married couples is from 59.4 to 60.2 percent.

Standard error of a difference. For a difference between two sample estimates, the standard error is approximately equal to

$$\sigma_{(x-y)} = \sqrt{\sigma_x^2 + \sigma_y^2} \qquad (5)$$

where σ_x and σ_y are the standard errors of the estimates x and y; the estimates can be of numbers, percents, ratios, etc. This will represent the actual standard errors quite accurately for the difference between two estimates of the same characteristic in two different areas, or for the difference between separate and uncorrelated characteristics in the same area. If, however, there is a high positive (negative) correlation between the two characteristics, the formula will overestimate (underestimate) the true standard error.

Illustration of the computation of the standard error of a difference. As stated earlier, table A shows that in 1981, 59.8 percent of all households were maintained by married couples. Table A also shows that in 1970, 70.5 percent of all households were maintained by married couples. Thus, the apparent difference between the percent of households maintained by married couples in 1981 and 1970 is 10.7 percent. The standard error (σ_x) of 59.8 percent is 0.2 percent as shown above. Using formula (4) and the appropriate b parameter (1389) from table B-4, the approximate standard error(σ_y) of 70.5 percent is 0.2 percent. Therefore, using formula (5), the standard error of the estimated difference of 10.7 percent is about

$$\sqrt{(0.2)^2 + (0.2)^2} \doteq 0.3 \text{ percent}$$

This means that the 68-percent confidence interval for the difference between the households maintained by married couples in 1981 and 1970 is from 10.4 to 11.0 percent, and the 95-percent confidence interval is from 10.1 to 11.3 percent.

Standard error of a ratio. Certain mean values for persons in families shown in the tables of this report were calculated as the ratio of two numbers. For example, the mean number of persons per family is calculated as

$$\frac{x}{y} = \frac{\text{total number of persons in families}}{\text{total number of families}}$$

Standard errors for these means may be approximated as shown below. There are two cases to consider. In either case, the denominator y represents a count of families of a certain class, and the numerator x represents a count of persons with the characteristic under consideration who are members of these families.

Case 1: There is at least one person having the characteristic in every family of the class: as for example, the mean number of persons per family or the mean number of persons per family with a male householder. For ratios of this kind, the standard error is approximated by the following formula:

$$\sigma_{\frac{x}{y}} = \sqrt{\left(\frac{x}{y}\right)^2 \left[\left(\frac{\sigma_y}{y}\right)^2 + \left(\frac{\sigma_x}{x}\right)^2 - 2\rho\left(\frac{\sigma_x}{x}\right)\left(\frac{\sigma_y}{y}\right)\right]} \qquad (6)$$

The standard error of the estimated number of families, σ_y, and the standard error of the estimated number of persons with the characteristic in those families, σ_x, may be calculated by the methods described above. In formula (6), ρ represents the correlation coefficient between the numerator and the denominator of the estimate. In the above example, and for other ratios of this kind, use 0.7 as an estimate of ρ.

Case 2: The number of persons having the characteristic in a given family may be 0, 1, 2, 3, or more: for example, the mean number of persons under 18 years of age. For ratio of this kind the standard error is approximated by formula (6) but ρ is assumed to be zero. If ρ is actually positive, then this procedure will provide an overestimate of the standard error of the ratio.

Standard error of a median. The sampling variability of an estimated median depends upon the form of the distribution as well as the size of its base. An approximate method for measuring the reliability of an estimated median is to determine a confidence interval about it. (See the section on sampling variability for a general discussion of confidence intervals.) The following procedure may be used to estimate the 68-percent confidence limits of a median based on sample data.

1. Determine, using the standard error tables and factors or formula (4), the standard error of the estimate of 50 percent from the distribution.
2. Add to and subtract from 50 percent the standard error determined in step (1).
3. Using the distribution of the characteristic, calculate the values from the distribution corresponding to the two points established in step (2). These values will be the limits for the confidence interval.

A 95-percent confidence interval may be determined by calculating the values corresponding to 50 percent plus and minus twice the standard error determined in step (1).

Illustration of the computation of a confidence interval for a median. Table 17 of this report shows that the median age of wives was 42.0 years in 1981. The size, or base, of the distribution from which this median was determined is 49,896,000.

1. Using formula (4), the standard error of 50 percent on a base of 49,896,000 is about 0.3 percent.

2. To obtain a 95-percent confidence interval on an estimated median, add to and subtract from 50 percent twice the standard error found in step (1). This yields percent limits of 49.4 and 50.6.

3. From table 17, 35.9 percent of wives were under 35 years old and 20.1 percent were between 35 and 44 years old. By linear interpolation, the lower limit on the estimate is found to be about

$$35 \text{ yrs.} + (45-35)\left[\frac{49.4 - 35.9}{20.1}\right] = 41.7 \text{ years}$$

Similarly, the upper limit may be found by linear interpolation to be about

$$35 \text{ yrs.} + (45-35)\left[\frac{50.6 - 35.9}{20.1}\right] = 42.3 \text{ years}$$

Thus, the 95-percent confidence interval for the median age of wives is from 41.7 to 42.3 years.
